COMAIN: CONTAINS A CENTRAL DOMAIN (SUBSTRATE DOMAIN) CONTAINING MULTIPLE POTENTIAL SH2-BINDING SITES AND A C-TERMINAL DOMAIN CONTAINING A DIVERGENT HELIX-LOOP-HELIX (HLH) MOTIF. THE SH2-BINDING SITES PUTATIVELY BIND CRK, NCK AND ABL SH2 DOMAINS. THE CC HLH MOTIF IS ABSOLUTELY REQUIRED FOR THE INDUCTION OF PERUDHYPHAL GROWTH IN YEAST AND MEDIATES HETERODIVERIZATION UTTH CASL.

CC -I-DOMAIN: A SERINE-RICH REGION PROMOTES ACTIVATION OF THE SERUM CC -I-DOMAIN: THE SH3 DOMAIN IS NECESSARY FOR THE LOCALIZATION OF THE SH3 DOMAIN IS NECESSARY FOR THE LOCALIZATION OF THE PROTEIN TO FOCAL ADHESIONS AND INTERACTS WITH ONE PROLINE-RICH REGION OF FOCAL ADHESION KINASE 1 PROSPHORYLATES THE PROTEIN AT THE CLUTTED TO THE PHOSPHORYLATED SITES AND CAN PROSPHORYLATE OTHER TYROSINE RESIDUES. TYROSINE PHOSPHORYLATION IS TRIGGERED BY INTEGRIN MEDIATED ADHESION OF CELLS TO THE EXTRACELLULAR MATRIX.

CC -IDISEASE: APPEARS TO HAVE A CENTRAL FUNCTION IN TRANSFORMATION OF

                                    FUNCTION: May be involved through its interaction with the integration of cytoskeletal network with vesicular trafficking, nucleocytosolic shuttling, transcription, remodeling and cytokinesis.
SUBUNIT: Interacts with IRPPRC.
ALTERNATIVE PRODUCTS: 2 isoforms; A (shown here) and B/CECR2B; are produced by alternative splicing.
TISSUE SPECIFICITY: Highly expressed in skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STGSTRSSQSASSLEVV

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as Duchenne muscular dystrophy and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the xenopus chisel protein (Csl), that is a member of the EF-Hand protein super family and is involved in signalling pathways. Csl protein is localised to the nucleus and does not show significant homology to any known protein. Structural homology between Csl and scallop regulatory myosin light chain is however detected. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects
                                                                                                                                                                                                                                                                               Chisel protein; Csl; EF-Hand protein super family; muscle development; heart/skeletal muscle cell development; signalling pathway; regulation; Xq21.3-q22; adaptive process; muscle homeostasis; cardiac hypertrophy; detection; diagnosis; prophylaxis; treatment; differentiation; nucleus; muscular and myotonic dystrophy; Duchenne muscular dystrophy; therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of the EF-Hand protein super family and is involved in signalling pathways. Csl protein is localised to the mucleus and has 86% homology between Csl and scallop regulatory to the mouse Csl. Structural homology between Csl and scallop regulatory myosin light chain is also detected. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular dystrophy actic on the production of enuscular dystrophy, myocarditis, myofiber atrophy, heart failure, cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           र्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans to ra heart disease or for an acute state of such a disease. It is also useful to treat diseases of the heart such as congestive heart failure, and the cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, myopathy, pulmonary hypertension, pulmonary heart disease, systemic arterial thypertension, pulmonary hypertension, pulmonary heart disease, with the art disease, congenital heart disease, pericardial disease and conductation. Sequences of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention are also used in gene therapy. The art disease is the invention are also used in gene therapy. The conductation is the development for medicaments for the treatments of the invention are also used. The present sequence is 66214 protein encoded by an anxiety disease. The present sequence is 66214 protein encoded by an anxiety disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC The present sequence is the murine chisel protein (Csl), that is a CC member of the EF-Hand protein super family and is involved in signalling CC pathways. Csl protein is localised to the nucleus and does not show CC significant homology to any known protein. Structural homology between CC cl and scallop regulatory myosin light chain is however detected. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects cof differentiation or adaptive processes that maintain muscle cc homostasis. This sequence can be used in the detection, diagnosis, cc prophylactic and therapeutic treatment of diseases such as those cc involving aberrant muscle cell development and functional activity. It cs is also used in the treatment of muscular dystrophy and Becker's skeletal myopathies such as Duchenne muscular dystrophy, myocarditis, cmyofiber atrophy, etc. The Csl gene sequence can also be used in gene cc therapy, for the production of transgenic animals and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
               CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical cimaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations CC amino acid sequences of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                      RESULT 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags of ridentifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or creating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical company of sites expressing (II), (I) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC and to produce other types of data and products dependent on DNA and company and activity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human cc diagnostic amino acid sequences of the invention.

CC specification, but was obtained in electronic format directly from WIPO care for the purpose of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling a cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
 Drosophila; developmental biology; cell signalling; insecticide; pharmaceutical.

 CC polynucleotides are also used in diagnostics as expressed sequence tags
CC for identifying expressed genes. (I) is useful in gene therapy techniques
CC to restore normal activity of (II) or to treat disease states involving
CC (II). (II) is useful for generating antibodies against it, detecting or
CC quantitating a polypeptide in tissue, as molecular weight markers and as
CC a food supplement. (II) and its binding partners are useful in medical
CC imaging of sites expressing (II). (I) and (II) are useful for treating
CC disorders involving aberrant protein expression or biological activity.
CC The polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification or mutations
CC responsible for genetic disorders or other traits to assess blodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences of the invention.
CC Note: The sequence data for this patent did not appear in the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequences.

 The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor 1C, cellular tumour antigen P53, and vasoactive intestinal polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis,
 Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies

DATABASE: NAME=R&D SYBTEMS'
 DISEASE: DEEECTS IN ECGF1 ARE THE CAUSE OF MITOCHONDRIAL NEUROGASTROINTESTINAL ENCEPHALOMYOPATHY (MUGIE) (ALSO KNOWN AS MYCNEUROGASTROINTESTINAL ENCEPHALOMYOPATHY); AN AUTOSOMAL RECESSIVE HUMAN DISEASE ASSOCIATED WITH MULTIPLE DELETIONS OF SKELETAL MUSCLE MITOCHONDRIAL DNA (MTDNA). IT IS CLINICALLY CHARACTERIZED BY ONSET BETWEEN THE SECOND AND FIFTH DECADES OF LIFE, PTOSIS, PROGRESSIVE EXTERNAL OPHTHALMOPLEGIA, GASTROINTESTINAL DYSMOTILITY (OPTEN PSEUDOOBSTRUCTION), DIFFUSI LEUKOENCEPHALOPATHY, THIN BODY HABITUS, PERIPHERAL NEUROPATHY, MYCPATHY
 ribose 1-phosphate.

PATHWAY: Nucleotide and deoxyribonucleotide catabolism.
SUBUNIT: HOWODIMER.

DISEASE: DEFECTS IN ECGF1 ARE THE CAUSE OF MITOCHONDRIA
 SOURCES OR IN THE RI
SYNTHESIS.
CATALYTIC ACTIVITY:
 ENDOTHELIAL CELLS IN VITRO.

FUNCTION: CATALYSES THE REVERSIBLE PHOSPHOROLYSIS OF THYMIDINB.

THE PRODUCED MOLECULES ARE THEN UTILIZED AS CARBON AND ENERGY
SOURCES OR IN THE RESCUE OF PYRIMIDINE BASES FOR NUCLEOTIDE
 FUNCTION: MAY HAVE A ROLE IN MAINTAINING THE INTEGRITY OF THE BLOOD VESSELS. HAS GROWTH PROMOTING ACTIVITY ON ENDOTHELIAL ANGIOGENIC ACTIVITY IN VIVO AND CHEMOTACTIC ACTIVITY ON
 DATABASE: NAME=R&D Systems' cytokine mini-reviews: ECGF1; WWW="http://www.rndsystems.com/asp/g_sitebuilder.asp?bodyId=219".

# Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Listing first 45 s
 Total number of hits satisfying chosen parameters:
 Perfect score:
 OM nucleic - nucleic search, using sw model
 Scoring table:
 00000
 ĕ
 111111111
9876543210987654321
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is the cDNA encoding the human chisel gene (Cs1) that is mapped to the human chromosome Xq21.3-q22. It comprises 5 exons. It is a member of the EP-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as Duchemne muscular dystrophy and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for

 derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
 The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs

 The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method come is used for testing the predisposition of mammals and preferably humans comeful to treat disease of the heart such as congestive heart failure, also consider the cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, hypertension, pulmonary hypertension, pulmonary heart disease, systemic arterial hard tisease, congenital heart disease, pricardial disease, valvular heart disease, congenital heart disease, pricardial disease and conduction of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicaments for the treatments of heart disease. The present DNA sequence is expressed sequence tag (EST) 66214 clone.

 immunosuppressive; antiHIV; antiHIAmmatory, notropic; neuroprotective; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; antiasthma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or ambitological conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the proteins in a sample or by determining the presence of mutations in the proteins in a sample or by determining the presence of the polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foculae developing products for the diagnosis or treatment of candimmune diseases, blood disorders, diseases of the immune system, allergies, Alzheimer's and behavioural disorders, schizophrenia, contemporosis, arthritis, infections, AllS, spinal cord injuries, cradiovascular disorders, reproductive disorders, gastrointestinal cardiovascular disorders, reproductive disorders, gastrointestinal cord disorders, respiratory disorders and metabolic disorders. The proteins of polynucleotides can also be used as food additives or preservatives. The proteins are also useful for identifying their binding partners.

CC AAA26337 to AAA26345 and AAY91450 are sequences used in the

 conjugating enzymes (UCE) 7, 8, and 9 respectively. Mammalian cells contain two distinct proteolytic pathways, one of which is ubiquitin to dependent. This proteolytic pathway requires the post-translational cell attachment of ubiquitin to other proteins using UCEs, such as the encoded proteins. Ubiquitin-protein conjugation is highly selective and is required for a large variety of cellular functions, including DNA repair, cell viability, heat shock resistance, and cell cycle progression. The UCEs 7, 8, and 9 may also play a role in selective protein degradation in human cells. The UCE proteins encoded by these cellular functions are used to treat patients that require one of the UCEs, or need one of the UCEs inhibited. The three UCEs can also be used to treat immunosuppression related disorders, such as typersensitivity or aspirin-induced asthma. Antagonists against the UCEs can be used to treat disorders such as hymenoptera venom typersensitivity or aspirin-induced asthma. Antagonists against the UCEs can be used to treat disorders such as Alzheimer's disease, altophying skeletal muscle, African swine fever virus, and apoptotic cell

 (UCE) 7. UCE polypeptides were expressed intracellularly via gene Ct therapy and can be used to provide a signal for the lymphocyte comming receptor, thereby regulating lymphocyte trafficking. The growth common receptor is modified by ubiquitin and UCE polypeptides may be used to regulate growth hormone activity. UCE polypeptides can be used to overcome viral infection by suppressing programmed cell death, e.g. in the treatment of AIDS. They can also be used to inhibit the cytotoxic properties of platelets and the production of oxygen metabolites by CC properties of platelets and the production of oxygen metabolites by CC platelets. They may be used to regulate immunological disorders in which CC platelets seem to be involved, e.g. hymenoptera venom hypersensitivity and aspirin-sensitive asthma. The UCE polypeptides may also be used to treat malignant transformation because proto-oncoproteins c-Mos and CC v-Jun are degraded in a ubiquitin-dependent manner. UCE antagonists, care able to pass through the cell membrane and bind to the proteins CC satelytic sites, may be used in the treatment of diseases in which UCE catalyses the transfer of ubiquitin to a substrate and marks that CC comphise follows:

 A cDNA sequence (AAT41769) comprises the coding region for human ubiquitin-conjugating enzyme UBC4 (AAW00352). It was obtd. from an HeLa cDNA library by PCR amplification (see also AAT41765-68). The cDNA was incorporated into a baculovirus vector and used to produce recombinant UBC4 in Spodoptera frugiperda 5:9 cells, and into a pGEX vector to allow UBC4 prodn. in E. coli. UBC4 can be used in a novel ubiquitin-conjugating system to identify inhibitors ubiquitin-mediated proteolysis of cell cycle regulatory proteins.
 Detecting inhibitors of ubiquitin-mediated proteolysis of CCRPs used in the treatment of proliferative and/or differentiation diseases, and in modulation of apoptosis \frac{1}{2} \int_{-\infty}^{\infty} \frac{1}{2} \int_{-\infty}^

 151;
 Single path sequence (manual checked and edited) with a vector primer of clone xh8H11. Sequence starts with base 1 following the determined vector sequence (ACCGGGTGgggcgCT, small letters: NotI-site). ESTs 3055-10R-8H11-2, 3055-10U-8H11-2 (with vector primers) and 8H11-R1-C8-OZ, 8H11-U1-C7-OZ (with gene specific primers) provide a contig of the whole insert of clone xh8H11. Insert Length: 850 Std Exror: 10.00 plate: 8 row: H column: 11
 1 (bases 1 to 360)

Zhuchenko,O., Patzak,D. and Wehnert,M.
